

How to Use

Every command is the full line — copy, paste, and replace the job ID (224) with yours. Full reference in [ADMIN_GUIDE.md](#).

Finding job IDs

```
# List Open job openings and their IDs (default)
uv run main.py --list-jobs

# List jobs of a specific status: Open | "On Hold" | Filled | Canceled | Draft
uv run main.py --list-jobs --status Filled

# List every job regardless of status
uv run main.py --list-jobs --status All
```

Downloading resumes

```
# Download all resumes for a job, sorted into stage subfolders

uv run main.py --job-id 224

# Re-download everything, ignoring the cache (use after resumes change in
BambooHR)

uv run main.py --job-id 224 --force

# Download only certain applicants: ALL | ALL_ACTIVE | ACTIVE | HIRED |
INACTIVE

uv run main.py --job-id 224 --applicant-status HIRED

# Save to a custom folder instead of ./downloads

uv run main.py --job-id 224 --download-dir C:\Resumes\Job224
```

```
# Slow down / speed up API calls (seconds between calls; default 2.0)
```

```
uv run main.py --job-id 224 --delay 1.0
```

Reports & maintenance

```
# Show the dashboard from saved state - no API calls, no downloads
```

```
uv run main.py --job-id 224 --report
```

```
# Reorganize old v1 flat files into v2 stage subfolders (no re-download)
```

```
uv run main.py --job-id 224 --migrate
```

Setup & connection

```
# Test the API connection (validates your .env key + subdomain)
```

```
uv run main.py --test
```

```
# Print the tool version
```

```
uv run main.py --version
```
